Estimated Production of Selected Commodities
in the Sino-Soviet Bloc, 1955-56 (cont.)

1. Includes crude oil plus those amounts of natural gas liquids that are produced in the fields and shipped with the crude oil from the fields.
2. Does not include natural asphalt.
3. Data are not available for any component of the Sino-Soviet Bloc on which to base an estimate of the quantity of secondary aluminum used each year. Secondary aluminum is defined as consisting only of old scrap and does not include industry scrap or run-around scrap, which is considered part of inventory stocks. Among the factors on which the amount of old scrap used each year by the aluminum industry depends are the length of time that the metal has been in common use in the country and the relationships between cost and price of both primary aluminum and old scrap.
4. Data on the quantity of commercial-grade aluminum produced by the Fu-shun aluminum reduction plant are not available. The Chinese Communists reported that "by the end of November (1955) annual production targets had been overfulfilled or almost fulfilled for alumina and aluminum ingots." The capacity of the plant is believed to be about 12,000 tons per year. Whether capacity operation and commercial-grade production of aluminum will be attained in 1956 is uncertain.
5. Steel for ingots and castings.
